

## EMERGENCY STEEL FIRE EXIT DOORS REPAIRS & SERVICE

Emergency Steel Fire Exit Doors can be forgotten by the employers and are often excluded from any service regime. Due to the fact that the doors are rarely used on a daily basis. However this is a mistake as the product title states "Emergency Fire Exit Door". This product is designed for a fast & safe means of escape for personnel during a fire condition. The thought of the door not opening during a real fire and personnel being hurt is not worth thinking about. This could also expose the employer to prosecution.

**We would like to offer our services in carrying out a Service Contract on your Fire Exit Doors.**

A service label would be discreetly placed inside the frame.

Signage is checked & replaced in full if required.

Thresholds are checked for any deformity. If the membrane is broken underneath the Threshold then water ingress can occur.

Our Engineers check & replace any worn or damaged seals. Damaged seals allow thermal leakage which adds pounds to your heating bill & increases your company Carbon Footprint.

Existing hinges can be upgraded on site with new Anti-Jemmy Dog Bolt Hinges.

Circumstances often change & sometimes the employer may require entry from the outside. Our Engineers can retrofit an External Access Device on site.

Friction Stays or Door Closers are adjusted to prevent any over travel which can sprain the hinges, twist the frame or damage any adjacent sheeting.

Operation of Panic Bar mechanisms are checked on site (we carry in stock various ranges of Panic Bar hardware).

Doors can be upgraded with kickplates to prevent dents in the door leaf (if the door is used regularly)

Our Engineers check & replace any worn or damaged seals. Damaged seals allow thermal leakage which adds pounds to your heating bill & increases your company Carbon Footprint.

Panic Rods & Pullman catches are checked for alignment & damage security of the door can be compromised if they are not engaging in the frame correctly.

Mechanical Stops can be fitted outside to prevent over travel, spraining of the hinges & twisting of the frame for windy exposed doors.

**ANY UPGRADE/MODIFICATION TO THE DOOR MUST BE CARRIED OUT BY A QUALIFIED DOOR ENGINEER**
