

PROJECT: Commercial Unit, Leeds

PRODUCT: Repair & Security Upgrade Following Ram Raid

A&C Engineers were called out to a sectional overhead door that had been ram raided.

Our client had a high value amount of stock and it was an imperative that the door was secured the same day. Due to having a stock of repair panels at all times within our factory. We were able to not only secure the door the same day but got the door fully operational.

Our client requested a prevention to any further ram-raid attacks. To prevent any further attacks our engineers installed a pair of Telescopic Anti-Ram Raid Bollards in front of the doorway.

The bollards retract flush with the concrete floor during working hours and are raised after closing. Each bollard is provided with a security anti-cut pad lock.
